

Workflow

Creation of the main initialization data:

- Warehouses
- Currencies
- Category, sub family and family

Screen Purchase
(tab supplier)

1

Creation of the supplier

Screen Item

2

Creation of the main info of an item: reference,
description, currency, supplier, category....

Screen Purchase

3

Creation of the purchase

Screen item

4

In this step the calculated or updated information is showed in the item screen (after the purchase)

NB: for the first transaction, the items purchased are the gold 24 k, alloys, and stones.

NB: in this stage we have quantity and prices and inventory reports

Production screen
(alloy tab)

5

We can in this screen mix 2 or more items and get one with a calculation of cost price in a prorata way (the new item should be created or already exist)

NB: the alloy procedure is a transfer between two warehouses (casting and metal treasurer), but the transfer is for two or more items and the return is for one. The warehouse casting will have an inventory when it has the items, and it will have a loss report when the procedure is done.

NB: Once the alloy is done, the metal exists in metal treasurer warehouse. It will be transferred to the goldsmith warehouse to do the model (maquette)

Screen Item
(transfer tab)

6

A metal form, sequential numbered, is fill with the date, source warehouse, target warehouse kind of the metal, quantity.

NB: what is the metal form

It is a form that contain the reference of the metal return, description, date, metal, weight, and it is used for the transfer of metal or pieces from a warehouse to another.

NB: the goldsmith is working on a model. Once he finishes it, a mold number (same as the reference number) is created (reference, goldsmith name, type of mold, number of molds, components or refer to....)

NB: once the mold is taken and created, the goldsmith returns the metal in 2 ways, via a metal return

A finished product

Metal

It will be transferred from the goldsmith to the metal treasurer and in case of loss, an in/out operation from the goldsmith is created

Here the phase Work in progress starts:

Creation of the worksheet

Manual

7

We create a worksheet (hard papers) with a serial number, date, reference (same as the mold reference or a new one), goldsmith and the weight of the piece.

At the same time a metal returned is filled (worksheet number, description, date, metal, weight, loss, reference and goldsmith name

Screen production (Production sheet tab)

Computer

7

In the production sheet screen, we have the serial number of production sheet, the worksheet, date, the client, the reference warehouse.

We have also in this screen summary of total material with their quantity and costs, the manufacturing costs and the cost. At this time the summary is empty.

NB: in the same time, a worksheet and a metal return are filled and they are hard copies.

What Is the worksheet:

it is a hard paper that contains all details of the item. The date, estimation delivery date, client code, reference, design, quotation, mold, description, part for the goldsmith, part for setting.... Every operation on this item should has a hard copy attached to the worksheet.

The kind of operations and the hard copies used with the worksheet:

- The metal returned: is the form where the goldsmith returns a finished item.
- The selection form: is the form where the stones are on the piece.
- The cutting form: is the form where is a cutting for a stone already on the piece. (it is not used on the current system and should be created in the new)
- The returned stones form: is the form where the stone is returned from the piece to the stock.
- the Avis form: is the form for describing the special operations with no special form.

Screen production (Consumption sheet tab)

In the consumption sheet screen, we have 2 parts:

- the first includes: the serial number of consumption sheet, date, production sheet number, the reference, the warehouse (goldsmith or stone selector), the Manufacturing, settings, threading, other direct cost, overhead...
- the second includes the ingredients of the piece with the qty, weight, unit price and cost.

The summary of consumptions should be shown in the production sheet.

Every hard copy with the worksheet should have a consumption on the system.

Execution of the metal returned

8

Computer

Metal returned already done manually and attached to the worksheet

Here the metal returned is filled on the computer with info of the first part and info of second part. (manufacturing, others and overheads). Here the warehouse is the goldsmith.

Once the piece is delivered from the goldsmith to the administration, the pieces are transferred manually (no computer operation) to the polish department and then to the setting department. After the setting of the piece, a summary is written on a hard copy called selection form which is attached to the worksheet.

Sometimes, where there is a cutting for the stone before setting, a hard copy called cutting form (weight of stone before and after cutting) is attached to the worksheet and no computer operation also

Execution of the selection form

9

Computer

Selection form already done manually and attached to the worksheet

Here the selection form is filled on the computer with info of the first part and info of second part (setting, threading and cutting).

Till now, the piece is in the phase work in progress and the quantity = 0
We can print a report for all pieces of the wip

Here the piece is finished from the goldsmith and the setter, it will pass by the polish department and go to the pricing.

The pricing procedure is done thru an excel file. (to be added to the new system).

After the pricing, the posting and close sheet of the piece, the phase WIP is done and the piece becomes a finished product with a quantity = 1.

The default warehouse in the warehouse mentioned in the production sheet. Usually it is the factory warehouse.

The general inventory is for all pieces existing in stock, purchased or manufactured.

The finished product is ready to be transferred to the point of sale with the summary transaction and the price.

A transfer note is created as a hard copy, sent with the piece to the shop. It contains the serial number of the transfer, date, source warehouse, target warehouse, item, description, qty, and the name and the signature of the persons who prepared, carried and received the pieces. After this procedure, the data entry officer can fill the

Stock screen (transfer tab)

Manual

10

Computer

The transfer is already done and the piece is transferred to the point of sale and the transfer is returned to the factory signed by the receiver.

The transfer is executed on the computer by filling the transfer tab by the reference of the hard copy of transfer, the date, source warehouse, target warehouse, item reference and quantity.

Sale screen (Invoicing tab)

11

Computer

Once the product is in the point of sale, it is sold thru an invoice. This invoice contains the serial number of invoice, the date, client, currency, salesman, warehouse description, item, qty, price, discount....

At the moment, the invoicing is done on a separated system in the POS and on excel in the factory.

On the dolphin system, once the invoice is transferred to the factory from the POS, it will be entered again.

All these transactions can be reversed:

- Sales: Sales return
- Transfer in: transfer out
- Close sheet, close again.
- Positive consumption: negative one.

- We can break the piece and doesn't exist anymore but the history for the item should be recorded
